Introduction to "EcoJourney":

- The Travel Agency Website is a dynamic and user-friendly web application developed to provide an easy and efficient platform for users to explore and book travel packages. The website is designed to simplify the travel planning process by offering detailed information about tour destinations, packages, pricing, and booking facilities in a well-structured and visually appealing format.
- This project was first designed as a prototype in Figma to ensure proper layout planning, color consistency, and user experience. After finalizing the design, the website was developed using HTML for structure, CSS for styling, Bootstrap for responsiveness, JavaScript for validation and interactivity, and jQuery for enhanced user interface functionality.
- The main objective of this project is to create a responsive and interactive travel website that allows users to browse tour packages, view details, and make bookings smoothly. The website focuses on user-friendly navigation, modern design, and efficient functionality to improve the overall user experience.
- This project demonstrates the practical implementation of front-end development concepts and showcases the complete workflow from design to deployment.

Structure of "EcoJourney":

Prototype:

The Figma prototype of the Travel Agency Website was created to visually design and plan the complete structure of the website before development. It helped in organizing layout, colors, typography, navigation flow, and user interaction.

1. **Screen Planning**
   The prototype contains multiple screens such as:
   - Home Page
   - Explore Guides Page
   - Guide Detail Page
   - My Route Page
   - About Us Page
   - Feedback Page
   - Login / Register Page

   Each screen represents one section of the final website.

2. **Layout Structure**
   In Figma:
   - Frames were used to create different pages.
   - Grid layout was used to maintain alignment.
   - Auto Layout was applied for consistent spacing.
   - Reusable components were created for:
     - Navbar
     - Buttons
     - Cards
     - Footer

   This ensures design consistency across all screens.
3. **Design System**
   A proper design system was followed:
   - Green color theme for eco-friendly travel concept.

- Playfair font for headings.
- Clean and modern typography.
- Consistent button styles.
- Rounded cards with shadow effects.

This design system was later implemented in CSS.

4. **Navigation Flow (Prototype Linking)**

Figma prototype feature was used to connect screens:

- Clicking “Explore” → Opens Guides Screen
- Clicking “Read Guide” → Opens Guide Detail Screen
- Clicking “Add to Route” → Opens My Route Screen
- Login button → Opens Authentication Screen

This simulates real website behavior before coding.

5. **Responsiveness Planning**

Different frame sizes were created for:

- Desktop view
- Tablet view
- Mobile view

This helped in implementing Bootstrap responsiveness later.

6. **Purpose of Prototype**

The Figma prototype helped in:

- Visualizing complete website structure
- Improving user experience (UX)
- Planning navigation before development
- Reducing design errors during coding
- Ensuring consistent UI design

Code:

The HTML file code represents the HTML5 skeleton and structural layer for a sustainable travel website called EcoJourney. It uses Bootstrap 5 for its layout and Lucide Icons for modern visuals.
The site is designed as a Single Page Application (SPA), meaning all sections (Home, Guides, About, etc.) exist in this one file, and JavaScript is used to hide or show them.

1. The Head Section (Metadata & Links)

- This part is the "brain" of the page that doesn't show up in the browser window but loads all necessary resources.
- External CSS: It pulls in Bootstrap 5 for the grid system and buttons.
- Fonts: It uses "Plus Jakarta Sans" for a modern feel and "Playfair Display" for elegant headings.
- Lucide Icons: A script that allows you to use icons like **`leaf`**, **`map-pin`**, and **`star`** by simply adding a tag.
- Custom Link: It connects to a local file **`Travel_agency.css`** for custom styling.

2. Navigation Bar (Header)

- A fixed-top menu that stays at the top as you scroll.
- Brand: Features a leaf icon and the name "EcoJourney."
- Links: Every link has an **`onclick="showSection('...')"`** attribute. This suggests a JavaScript function is handling the switching between pages without a full reload.

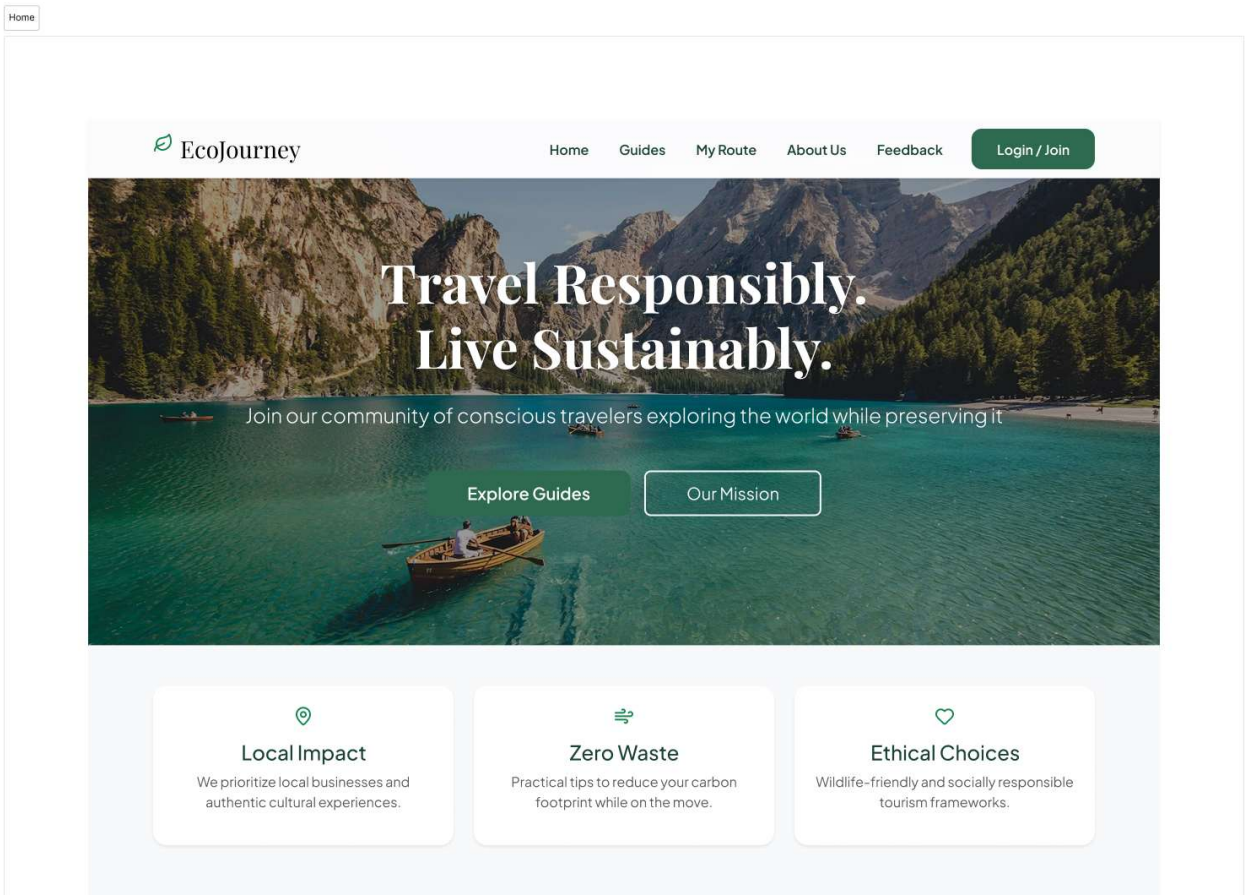
- Route Counter: A small badge next to "My Route" that displays a number (likely updated when you add destinations).
- Auth Logic: It has two containers: **`authLinkContainer`** (Login/Join button) and **`userProfileContainer`** (User profile dropdown). One is hidden while the other is shown depending on if the user is logged in.

3. Page Sections (The Content)

- The website is divided into several **`<section>`** tags. Each has a class **`page-section`**, but only the "Home" section has the **`active`** class by default.

A. Home Section

- Hero Area: A big, bold welcome message with "Explore Guides" and "Our Mission" buttons.
- Value Propositions: Three cards explaining "Local Impact," "Zero Waste," and "Ethical Choices" using icons.



B. Guides Section

- Search & Filter: Includes a search input and a category dropdown (Nature, Cultural, Urban, etc.).
- Grid: An empty **`div`** with **`id="guidesGrid"`**. This is a placeholder where JavaScript will dynamically "inject" travel destination cards.

C. Guide Detail Section

- This is a template section. When a user clicks a specific destination, JavaScript fills these IDs (**`detail-title`**, **`detail-desc`**, etc.) with the relevant data.
- Add to Route: A button allowing users to save the destination.

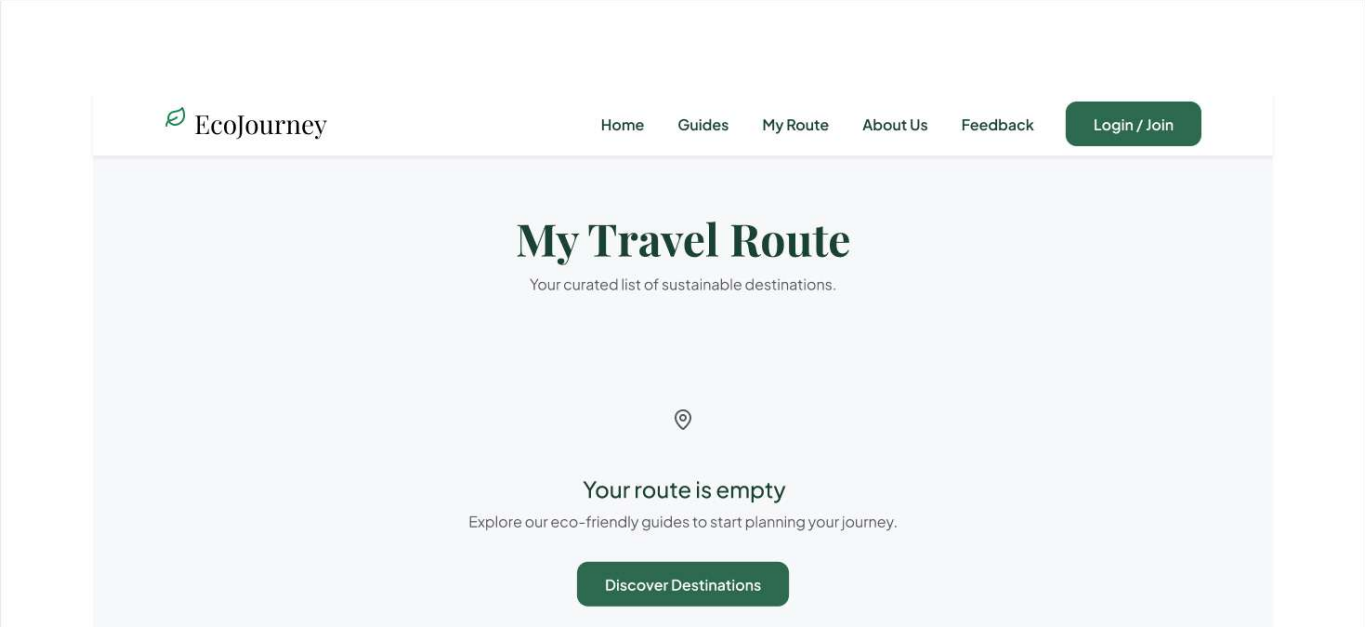
D. My Route Section

- Contains an Empty State (shown if you haven't picked destinations) and a Timeline (shown once destinations are added).

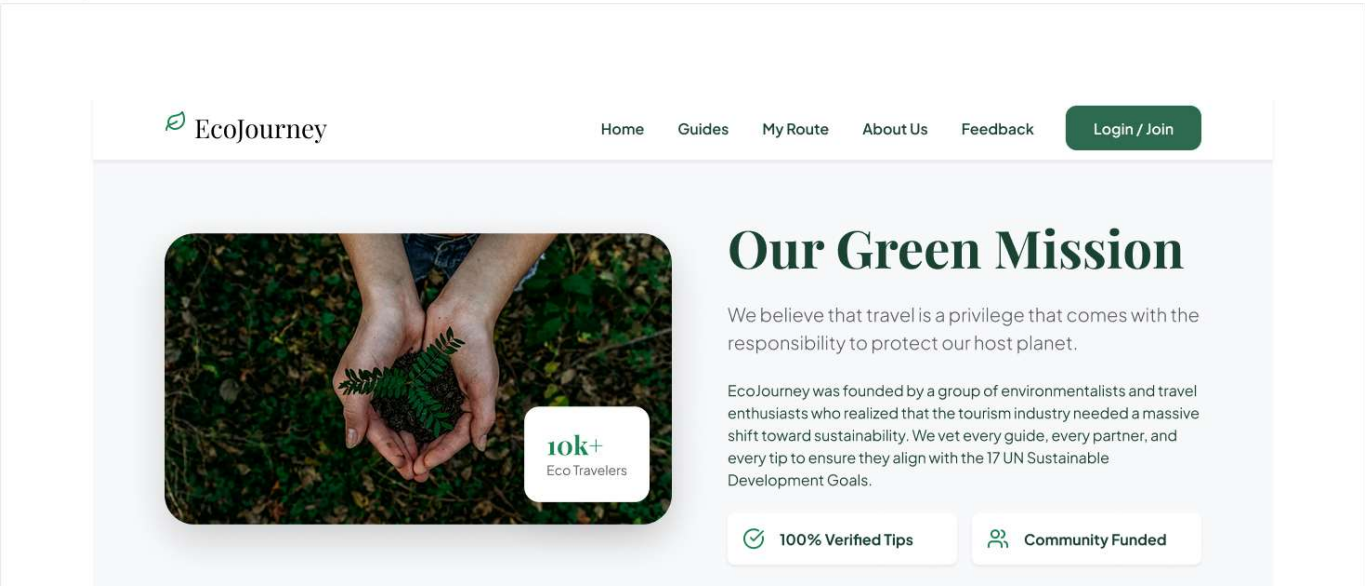
My_Route_page



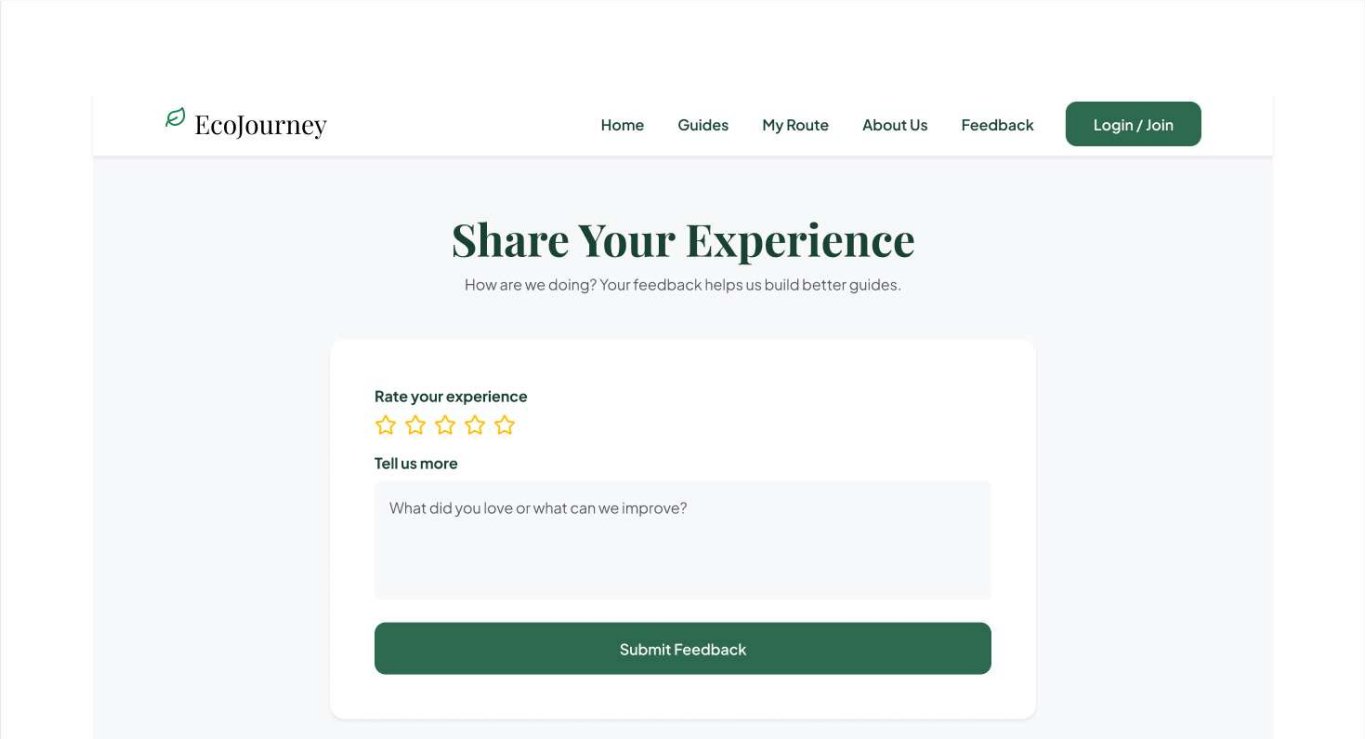
E. About Us & Feedback

- About Us: A mission statement with a "10k+ Eco Travelers" counter.
- Feedback: A form with a Star Rating system. The stars are Lucide icons with **`data-rating`** attributes for interactivity.

About_us_page



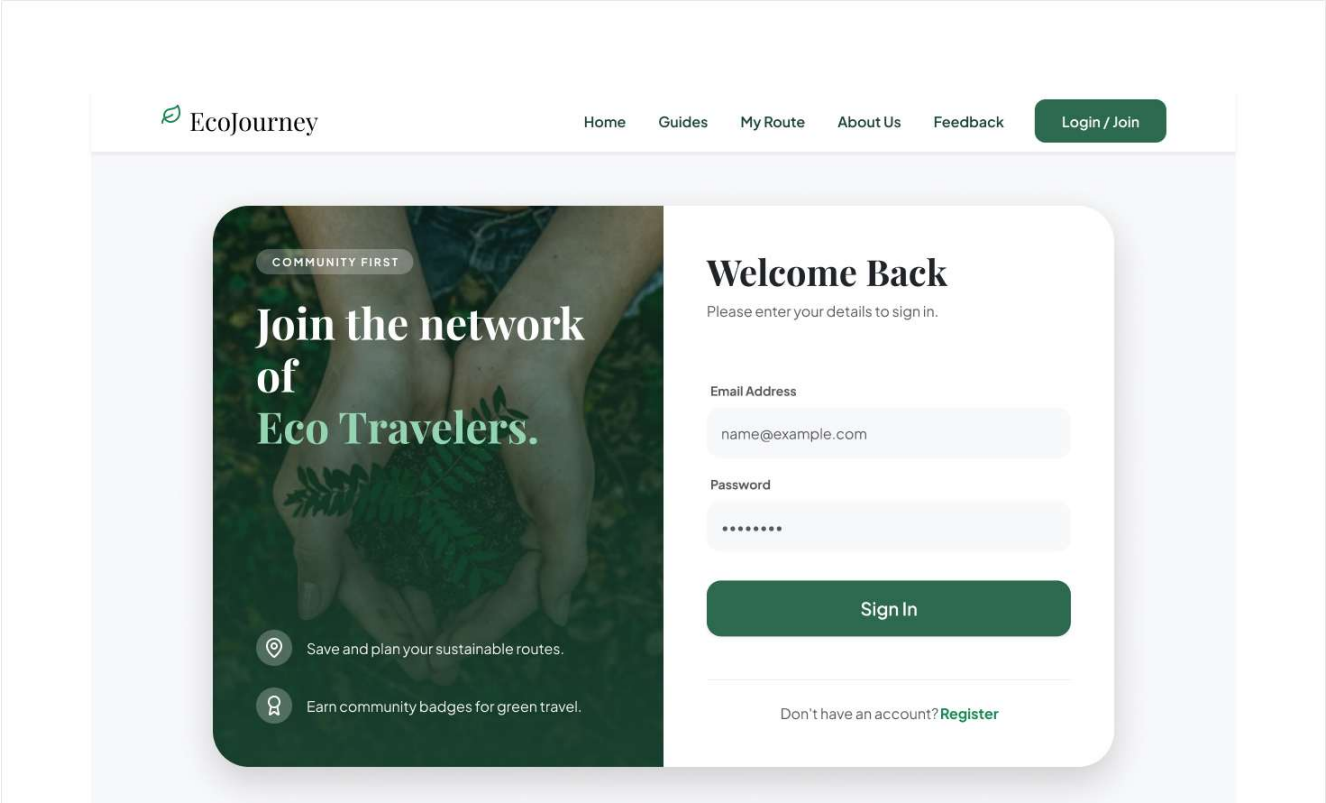
Feedback_page



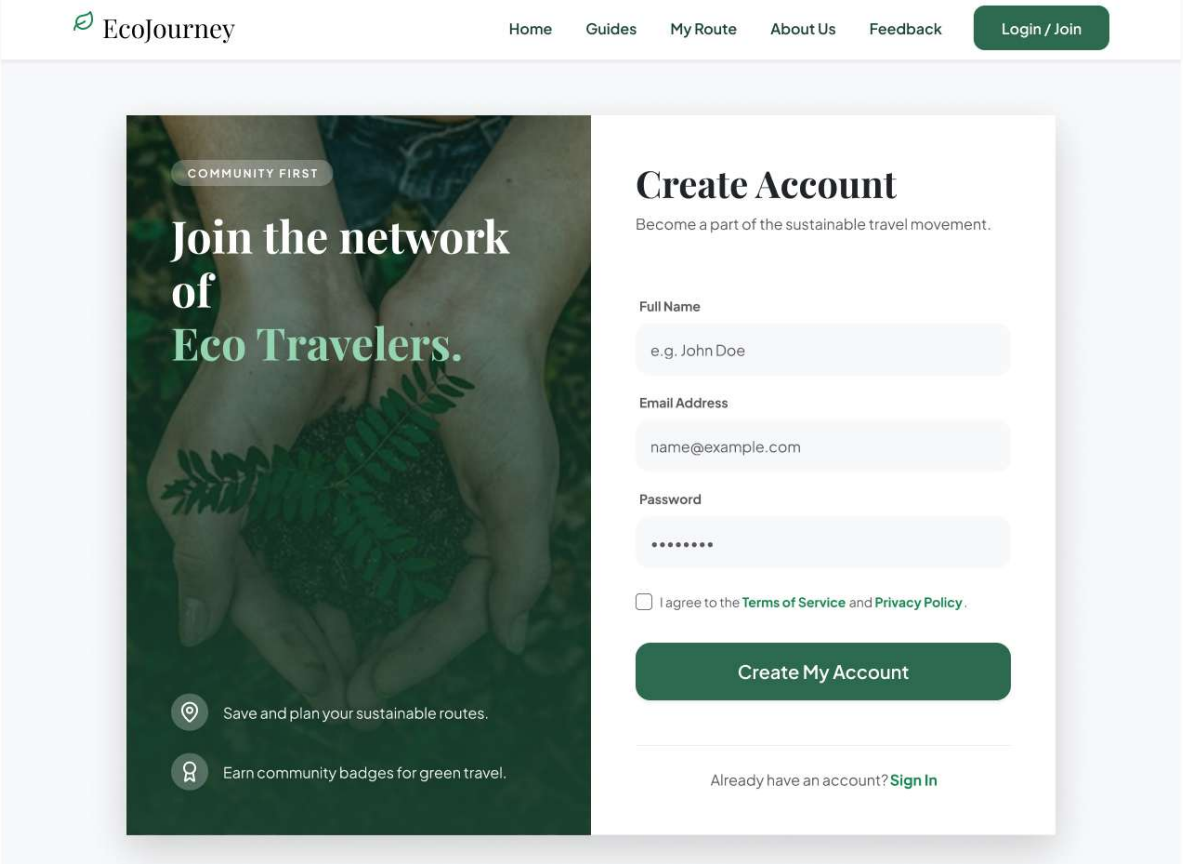
F. Authentication (Login/Register)

- A split-screen design.
- Left: Visual branding with an image.
- Right: A dynamic form. The **`id="registerFields"`** (the name input) and **`id="termsCheckGroup"`** are likely hidden/shown via the "Sign In" toggle link at the bottom.

Sign_up_page

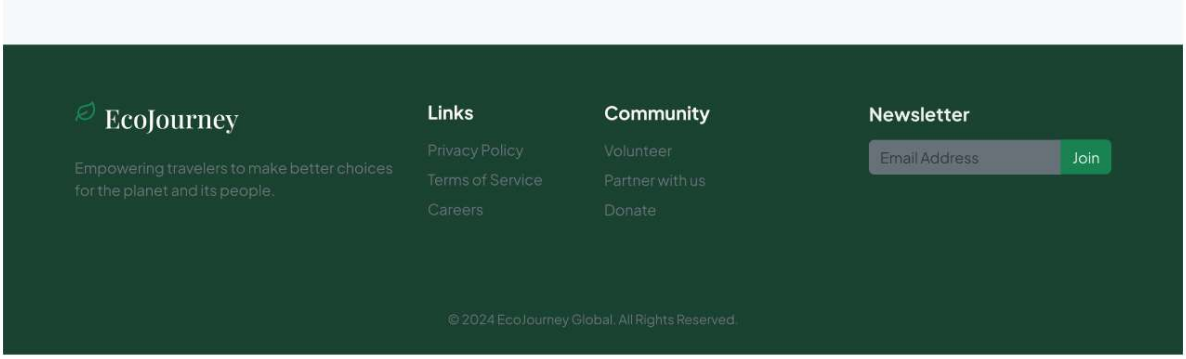


Register_page



4. The Footer

- Organized into columns for Links, Community, and a Newsletter signup.
- Uses a dark theme style (indicated by **`bg-secondary`** and **`text-white`** classes).



5. Scripts (The Functionality)

- At the very bottom, it loads:
- jQuery: To make DOM manipulation easier.
- Bootstrap JS: To make the dropdowns and mobile menu work.

- **`Travel_agency.js`**: This is the most important file for this site—it contains the logic for switching sections, filtering guides, and handling the "My Route" list.

How the "Navigation" works:

- Because all sections have the class **`page-section`**, the CSS (likely in your **`.css`** file) hides them by default (e.g., **`display: none;`**). When you click a link, the JavaScript function **`showSection()`** removes the **`active`** class from the current section and adds it to the new one.

This CSS code provides the styling and visual identity for the EcoJourney travel website. It focuses on a "Nature/Eco" aesthetic using greens and creams, while incorporating modern UI trends like glassmorphism (blurry backgrounds), smooth scroll animations, and interactive hover effects.

1. Design Fundamentals & Branding

The top of the file defines the "Source of Truth" for the design.

- CSS Variables (:root): These act as a color palette. If you want to change the "primary green" across the whole site, you only have to change it once here.
- Typography: It uses two distinct fonts:
  - Plus Jakarta Sans: A modern, clean sans-serif for body text and navigation.
  - Playfair Display: A classic, elegant serif font for headings ($h1, h2, h3$), giving it a "travel magazine" feel.

2. Global Layout & Custom Scrollbar

- Body Styling: Sets the background to a soft cream and ensures smooth scrolling (scroll-behavior: smooth).
- Webkit Scrollbar: This replaces the standard browser scrollbar with a custom, rounded version that uses a green gradient.

3. Motion & Animations

The code includes two types of animations to make the site feel premium:

- Scroll Reveal (.reveal): Any element with this class starts invisible and shifted down by 40px. When JavaScript adds the .active class, it slides up and fades in smoothly.
- Hero Fade-Up: A custom @keyframes animation that makes the text on the homepage "float up" into view as soon as the page loads.

4. Navigation (Glassmorphism)

The .navbar uses a modern backdrop-filter:

- Blur & Transparency: It creates a "frosted glass" effect, so you can see the colors of the images behind the bar as you scroll.
- Animated Underline: The .nav-link::after creates a green line that grows from 0% to 100% width when you hover over a menu item.

5. Components & UI Elements

A. Guide Cards

These are the "destination" cards.

- Hover Effect: When you hover, the card lifts up (translateY(-12px)) and the shadow becomes deeper.
- Image Zoom: The image inside the card scales up slightly (scale(1.05)) without changing the card's size, creating a high-end interactive feel.

B. Single Page Sections

- .page-section: By default, sections are hidden (display: none).
- .active: When a section is active, it switches to display: block and triggers a fade-in transition.

C. My Route Timeline

This creates a vertical "travel itinerary" look:

- The Line: Uses a ::before pseudo-element to draw a thin green vertical line.
- The Dots: The .timeline-dot places a green circle on that line for every destination added.
- Route Card Hover: If you hover over a saved destination, it slides slightly to the right (translateX(10px)).

6. Functional & Decorative Utility

- Eco Badge: A reusable rounded green tag for categories.
- Feedback Stars: Includes a simple hover effect (scale(1.2)) to make the rating system feel responsive.
- Search Bar: Uses absolute positioning to place the search icon *inside* the input field (padding-left: 45px).
- Custom Alert: A fixed alert box that appears at the top-right to confirm actions (like "Added to Route").

Summary Table of Key Styles:

Feature	CSS Technique Used	Effect
Colors	CSS Variables (--primary-green)	Consistent eco-branding.
Header	backdrop-filter: blur()	Modern "Glass" effect.
Animations	cubic-bezier transitions	Smooth, professional movement.
Cards	box-shadow & transform	Creates depth and interactivity.
Timeline	Pseudo-elements (::before)	Draws the "map route" line.

This JavaScript code is the "brain" of the EcoJourney web application. It handles everything from data management and dynamic content rendering to user authentication and scroll-based animations.

1. Data & State Management

The script begins by setting up the foundational data and the "current state" of the app.

- guideData: An array of objects representing 15 travel destinations. Each object contains IDs, titles, categories, and specific eco-travel details (tips, local spots).
- State Variables:
  - myRoute: An array that stores the IDs of destinations the user has saved.
  - currentUser: Keeps track of whether a user is logged in.
  - isLogin: A boolean used to toggle the UI between "Login" and "Register" modes.

2. Scroll Animations (Intersection Observer)

The code uses the Intersection Observer API to make the website feel interactive as the user scrolls.

- How it works: It watches elements with the class .reveal.

- The Trigger: When an element is 10% visible (threshold: 0.1), the script adds the CSS class .active.
- The Result: This triggers the CSS transitions (fade-in/slide-up) defined in your stylesheet.

3. Dynamic Content Rendering

Instead of writing 15 different HTML pages, the script uses Template Literals to build the UI dynamically.

A. renderGuides()

This function builds the "Explore Guides" grid.

- Filtering: it checks the search input and the category dropdown.
- Logic: It loops through guideData, checks if the item matches the user's search, and appends the HTML to the #guidesGrid.
- Fallback: If a destination image fails to load, the onerror attribute replaces it with a FALLBACK_IMG.

B. renderRoute()

This generates the "My Route" timeline.

- Mapping: It takes the IDs stored in the myRoute array, finds the matching data in guideData, and creates a vertical timeline.
- Empty State: If the user hasn't added any trips, it shows a "No routes saved" message.

4. Navigation & Section Switching

The function **`showSection(sectionId)`** acts as a Single Page Application (SPA) router.

- It hides all sections by removing the .active class.
- It shows only the requested section (e.g., 'home', 'guides', or 'my-route').
- It automatically scrolls the window to the top and re-initializes animations for the new content.

5. Guide Detail Logic

When a user clicks "Read Guide," the script:

1. Grabs the specific ID from the clicked button.
2. Finds the corresponding object in guideData.
3. Pre-loads the image: It creates a new **`Image()`** in the background. Once it's ready, it sets it as the hero background. This prevents "flashing" or white backgrounds.
4. Populates the lists for "Eco Tips" and "Local Spots" by looping through the arrays in the data.

6. User Authentication Simulation

The code simulates a backend system for Login and Registration:

- Toggle Logic: Clicking "Register" or "Sign In" dynamically changes the text of the headings and hides/shows the "Name" field.
- Submit: On form submission, it saves the user's name to currentUser and updates the navbar to show a "Profile" icon instead of a "Login" button.

7. Interactive Features

- Star Rating: When a star is clicked, the script calculates its index and "fills" all stars up to that number by adding the text-warning class.
- Alert System: **`showAlert()`** creates a temporary pop-up message (e.g., "Added to Route!") that automatically disappears after 3 seconds using **`setTimeout`**.

- Navbar Shadow: A scroll listener checks if the user has moved down more than 50px; if so, it adds a shadow to the navbar to make it stand out against the content.

Summary of Key Functions

Function	Purpose
initScrollAnimations()	Re-scans the page for items that need to animate in.
updateRouteUI()	Updates the little counter badge on the "My Route" nav link.
lucide.createIcons()	Re-renders SVG icons (needed after dynamic HTML is added).
logout()	Clears the user state and returns the app to the home section.

THE END
